

Developer Requirements

Existing Member Profile Claim Workflow

Date: February 25, 2026

Priority: High

Prepared by: DMoney

Overview

We need to build a workflow that allows existing league members to claim their player profiles on the new Courtsight League website. All player records (including email addresses) have already been migrated from the previous platform. The goal is to let returning players verify their identity via email, take ownership of their profile, and immediately access a fully functional account.

Preconditions

The following must already be in place before this workflow is triggered:

- All existing player records (name, email, team, stats) have been uploaded to the new site database.
 - Each player record has a status flag indicating it is unclaimed (e.g., status = "Unclaimed").
 - The email blast system is configured and ready to send claim invitations.
 - Team payment status is tracked at the team level (e.g., team.payment_status = "Paid" or "Unpaid").
-

User Flow: Step-by-Step

Step 1: Email Blast Trigger

An admin triggers a bulk email blast to all players with unclaimed profiles. Each email should include:

- A personalized greeting using the player's name on file.
- A unique, time-limited claim link (e.g., courtsightleague.com/claim?token=abc123).
- A clear call-to-action: "Claim Your Profile."

Requirement: The claim token must be unique per player, securely generated, and expire after 72 hours. Expired tokens should show a friendly error with an option to request a new link.

Step 2: Profile Confirmation

When the player clicks the claim link, they land on a Profile Confirmation page that displays:

- Their full name
- Their email address (partially masked for security, e.g., d***y@email.com)
- Their associated team name
- Season and league info (if applicable)

The player must explicitly confirm by clicking a "Yes, This Is Me" button. If the profile does not belong to them, provide a "This Isn't Me" option that redirects to a support/contact form.

Step 3: Account Setup

After confirming, the player is prompted to set up their account credentials:

- Create a password (enforce minimum security requirements: 8+ characters, at least one number and one special character).
- Optionally enable social login (Google) if supported.

On successful account creation, the system should:

1. Update the player record status from "Unclaimed" to the appropriate status (see Step 4).
2. Associate the new login credentials with the existing player profile.
3. Automatically log the player in.
4. Redirect the player to their profile page.

Step 4: Automatic Status Assignment

Upon claiming, the system must automatically set the player's account status based on their team's payment record:

- If the player's team has a payment status of "Paid" → set player status to "Paid-Active."
- If the player's team has a payment status of "Unpaid" → set player status to "Unpaid-Pending" (or equivalent).

This status should be visible on the player's profile and in the admin dashboard.

Step 5: Profile Page & Persistent Access

After claiming, the player should land on their profile page showing:

- Player name, photo (if available), team name, and account status (e.g., "Paid-Active").
- Season stats and game history (if data exists from the previous platform).
- Options to edit profile details (photo, contact info).

The player must be able to log out and log back in using their new credentials and return to the same profile with all data intact. Session management must persist the player's authenticated state appropriately.

In addition to the above, Captains should be able to invite their players to claim their profile by entering their email on the profile. And Admins should be able to select players on teams to claim their profile.

You may have to add payment status's associated with teams

Edge Cases & Error Handling

- Expired claim link: Show a clear message and allow the player to request a new claim email.
- Already claimed profile: If a player clicks a claim link for a profile that has already been claimed, display a message: "This profile has already been claimed. If you believe this is an error, please contact support."
- Email not found: If the token is invalid or doesn't match a record, show a generic error (avoid revealing whether the email exists in the system for security).
- Duplicate email addresses: If multiple player records share the same email, the confirmation step should present all matching profiles and let the user select the correct one.
- Password reset: After claiming, players should have access to a standard "Forgot Password" flow.

Acceptance Criteria

#	Acceptance Criteria	Status
1	Admin can trigger a bulk email blast to all unclaimed player profiles + Admin can select individuals to claim their profile	
2	Team captains can add emails to their team player profiles and invite them to claim their profile	
3	Each email contains a unique, secure, time-limited claim link (72-hour expiry).	
4	Clicking the claim link shows a confirmation page with player name, masked email, and team.	
5	Player can confirm ("Yes, This Is Me") or dispute ("This Isn't Me" → support form).	
6	After confirmation, player sets a password and an account is created.	
7	Player status is automatically set to "Paid-Active" if team payment = Paid.	
8	Player status is automatically set to "Unpaid-Pending" if team payment = Unpaid.	

9	Player is automatically logged in and redirected to their profile page after claiming.	
10	Player can log out and log back in with their credentials and see their profile.	
11	Expired tokens display a friendly error with an option to request a new claim link.	
12	Already-claimed profiles show an appropriate message and do not allow re-claiming.	
13	Duplicate email records allow the user to select from matching profiles.	

Technical Notes

- Claim tokens should be generated using a cryptographically secure method (e.g., UUID v4 or signed JWT).
- Store token expiry timestamps in the database; validate on every claim attempt.
- All claim and login endpoints must be served over HTTPS.
- Rate-limit the claim endpoint to prevent abuse (e.g., max 5 attempts per IP per hour).
- Log all claim events (success, failure, expired, already claimed) for admin audit purposes.
- Ensure the email blast system can handle batch sends without hitting provider rate limits (use queuing if needed).
